

BENEFITS

WHY JWPress?

Cold Press joint technology has been around for over a century.

Since the first design was patented, there have been a number of important evolutionary modifications. The focus of these improvements have been greater ease of installation, and increasing the reliability of modern cold press joining. That evolution has taken cold press joining from an interesting concept, the practical and efficient method of joining pipe and fittings.

JWPress, continues the quest of improved joint design, increased holding power, and greater reliability. With patented design improvements, we feel confident, and testing substantiates that we have accomplished both of these objectives.

At JWPress we understand that press tool and jaw sets are an expensive investment for the contractor, and inventory item for wholesalers. With that foremost in our minds, we set about our improvements respecting the need to use the “V” profile jaw sets for the whole range of fittings ½” through 4”. Our focus clearly on improvements to the seal mechanics, not the shell of the fittings.

At JWPress we feel confident that you will find that we have engineered a better, more reliable, and higher testing pressure joint with significantly improved anti creep features.

We have incorporated an improved design leak detection system into our jointing. All with the respect and consideration due to the end users of our products. Interchangeability, preventing added cost burdens, all the goals we feel you should expect from a manufacturer whose goal is to be the best at what we do.
